where $\delta_{i,j}$ is the Kronecker delta. Using this result and the properties of the Lorentzian $g(\eta)$ one can show that

$$\int_{-\infty}^{\infty} g(\eta) \left(C_0 + \sum_{q=1}^{n} C_q \{[\alpha(y,\eta,t)]^q + [\bar{\alpha}(y,\eta,t)]^q\} \right) d\eta$$

$$= C_0 + \sum_{q=1}^{n} C_q \{[z(y,t)]^q + [\bar{z}(y,t)]^q\} \quad (15)$$

Thus

$$I(x,t) = \int_0^L K(x-y) H(z(y,t);n) dy \quad (16)$$

where

$$H(z;n) = a_n \left(C_0 + \sum_{q=1}^{n} C_q (z^q + \bar{z}^q) \right) \quad (17)$$

(It can be shown that for impulsive coupling, $H(z;\infty) = (1-|z|^2)/(1+z+\bar{z}+|z|^2)$.)
